Fort Atkinson, WI 53538

**Winter Storage Share:  
Delivery 2 of 2  
November 19<sup>th</sup> / 21<sup>st</sup>**

## General Storage Tips:

As you get ready to pick up your second, and last, delivery we want to remind you of these general storage tips that can hopefully allow you to keep your storage vegetables for as long as possible. Almost all vegetables want it just above freezing, but below forty degrees. Almost all crops need it very dry and dark. Use any crop that may be nicked or bruised first. Go through your storage area once a week to determine which items may be showing signs of deterioration and use them first. Possible storage locations include a basement, cellar, or moderated garage. And remember, these are just general guidelines as storage techniques, vegetable makeup, spoilage rates, etc. are all different. It would not hurt to refer to some cookbooks and the internet for some additional or more specific storage tips.

## Specific Vegetable Tips:

**Potatoes: 15 lbs. ~** Potatoes should keep for months under good conditions. Remember potatoes are a living breathing seed. They are just biding their time waiting to sprout. Don't suffocate potatoes in a plastic bag. They are best stored at a temperature of 38 – 40 degrees, any colder and they may blacken when cooked. You can store them at warmer temperatures but the warmer the temperature, the less days they will store and the quicker they will sprout. Total darkness is also a key to storing potatoes. Do not store near onions.

**Carrots: 4-5 lbs. ~** Carrots are similar to beets in storage techniques. Carrots should have their green tops removed first to avoid the loss of moisture. Do not wash carrots before storing. Fresh carrots can be bagged (take as much air as possible out) or put in a plastic container and placed in the refrigerator. They can store for 1-2 weeks like this. A longer term storage technique would be freezing or canning carrots. They can keep several months like this. Do not store by potatoes.

**Red Cabbage: 4 heads. ~** Red cabbage is almost identical to green cabbage. It can keep for several weeks if stored properly. One of the best ways to store cabbage is to keep it wrapped or covered in the refrigerator. It would be best to keep it in a sealed container but wrapping it in some sort of plastic wrap or Ziploc bag is fine too. Cabbage is definitely one of the crops you want to keep checking for signs of spoilage. Do not wash again until ready to eat!

---

**Watermelon (Beauty Heart) Radish: 5 radishes.** ~ Many radishes are similar to carrots and beets in terms of storage techniques. Radishes should have their green tops removed first to avoid the loss of moisture. Do not wash radishes before storing. Fresh radishes can be bagged (take as much air as possible out) or put in a plastic container and placed in the refrigerator. They can store for 1-2 weeks like this. A longer term storage technique would be freezing radishes. They can keep several months like this.

**Turnips OR Beets** (you will be receiving one of these)

**Turnips: 5-7 Turnips.** ~ Turnips will store for a long time, up to 3 to 5 months. Like other green topped vegetables, they will store best if the greens are removed right away otherwise they will suck the moisture from the turnip root, leading to potentially faster spoilage. If washed and dried, the greens can store in a plastic food storage bag in the refrigerator for up to 4 or 5 days. The turnip root should be stored in a cool, moist, and dark location, specifically in single layers.

**Beets: 5-7 beets.** ~ Beets should have their greens removed first to avoid the loss of moisture. Do not wash beets before storing. Fresh beets can be bagged (take as much air as possible out) or put in a plastic container and placed in the refrigerator. They can last for about 1.5-2.5 weeks like this. A longer term storage technique is either canning or freezing beets. They can keep several months like this.

## **General Squash Storage Tips:**

**Acorn: 4-6 squash.**

**Butternut: 4-5 squash.**

**Squash ~** All winter squash stores in practically the same way. Winter squash needs temperatures right around fifty degrees. Temperatures lower than that sometimes can cause the squash to become stringy. They also do best in dark and moderately dry storage places. Squash will keep for three months or more if kept well.

Winter squash can also be frozen. Cook until soft in boiling water, in steam, in a pressure cooker or in an oven. Remove pulp from rind and mash. To cool, place pan containing squash in cold water and stir occasionally. Package leaving ½-inch headspace, seal and freeze.

**Thanks for a wonderful season! Have a Happy  
Thanksgiving and Merry Christmas!!**
